

ABSTRACT OF THE DISCLOSURE

The specification discloses a color level adjusting module and the method thereof. A data buffer unit stores image data sent from a data processing device. A look-up-table operating unit converts the data into printing data. A selector distributes the printing data and sends them to a print queue. The
5 module solves the problem that different chipsets have to be used for different printing modules. Only a single module is needed. Therefore, the production cost can be greatly reduced.
